Outline

- Metadata repository of marine resources in Canada;
- Aichi Biodiversity Targets (ABTs);
- Fuzzy logic framework;
- Evaluating Canada's progress towards the ABTs.

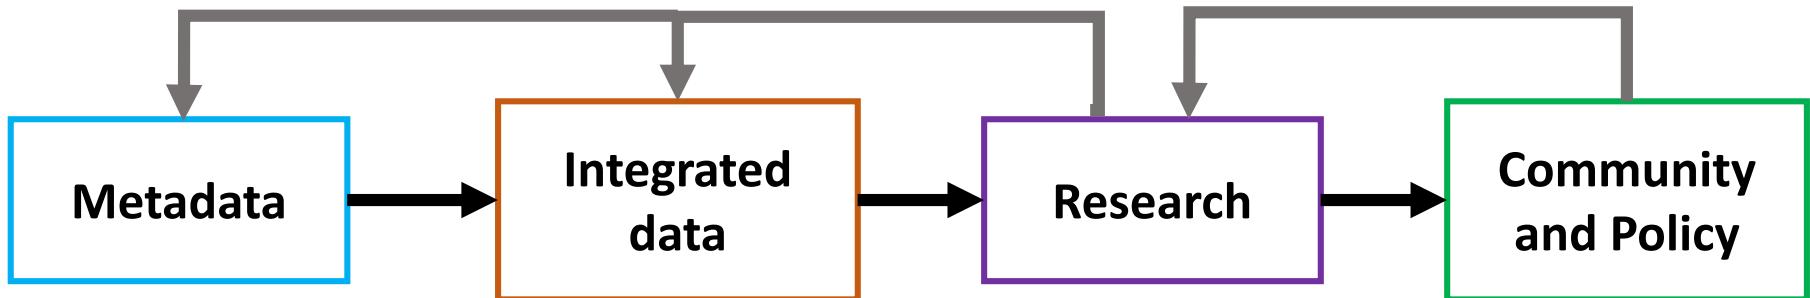

Metadata database

- Approx. 1,100 records referencing 16,500 individual time series;
- Government (702), NGO (314), academic (50);
- Arctic (76), Atlantic (476), Pacific (430), National (83).

Building a living database

- Accessibility is key for metadata records and corresponding data;
- Build on existing repository efforts and research networks;
- Lead with examples of the framework in practice (e.g. MPA policy, climate change impacts on BC communities including FN, scenarios for Arctic).

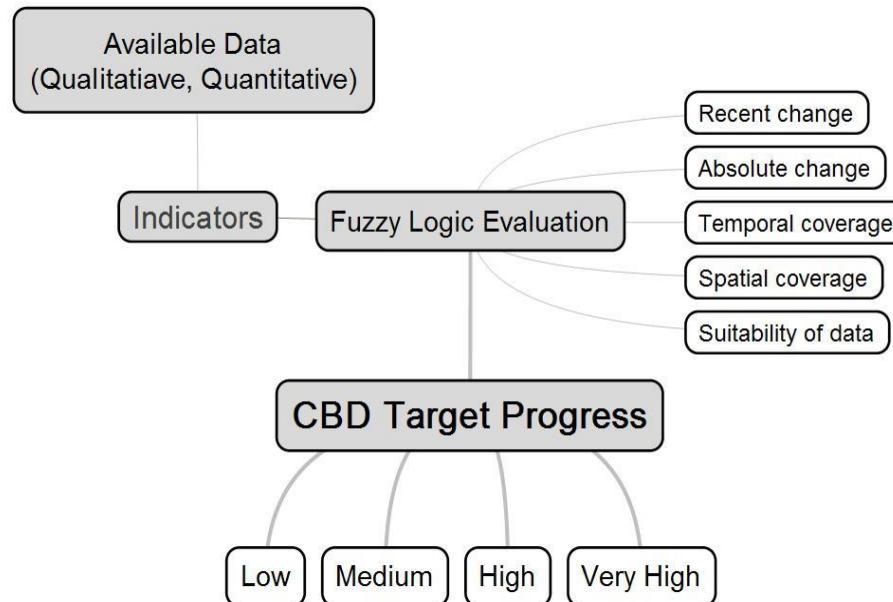

Aichi Biodiversity Targets

- Developed in 1993 by UN-CBD and mandated in Canada's Biodiversity Strategy;
- Promote sustainability through a range of strategies and benchmarks.

Strategic goals		Targets	
A	Mainstream biodiversity	 1 Understand values	 8 Reduce pollution
B	Promote sustainability	 2 Mainstream biodiversity	 9 Reduce invasive spp.
C	Safeguard ecosystems	 3 Address incentives	 10 Minimize reef loss
D	Enhance ecosystem services	 4 Sustainable production	 11 Protected areas
E	Build implementation capacity	 5 Halve rate of loss	 12 Prevent extinctions
		 6 Sustainable fisheries	 13 Conserve gene pool
		 7 Manage within limits	 14 Restore ecosystems
		 15 Enhance resilience	
		 16 Implement Nagoya Prot.	
		 17 Revise NBSAPs	
		 18 Respect and conserve TK	
		 19 Improve knowledge	
		 20 Mobilize resources	

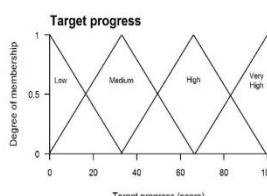

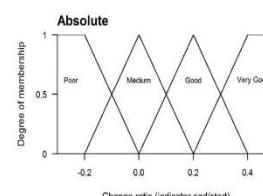

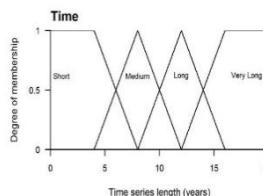

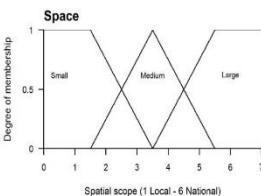

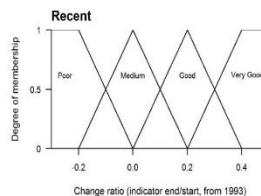

Evaluating biodiversity goals: fuzzy logic framework

- Lack of quantifiable objectives makes evaluating ABT progress difficult;
- Fuzzy logic is a formal quantitative approach to integrate data from diverse stimuli or inputs and evaluate a given problem (e.g. when should an AC start? How vulnerable are particular fish species to climate change?);
- In this case, the “problem” is progress towards the ABTs (marine realm), and the inputs are available indicators drawn from Canadian marine research.

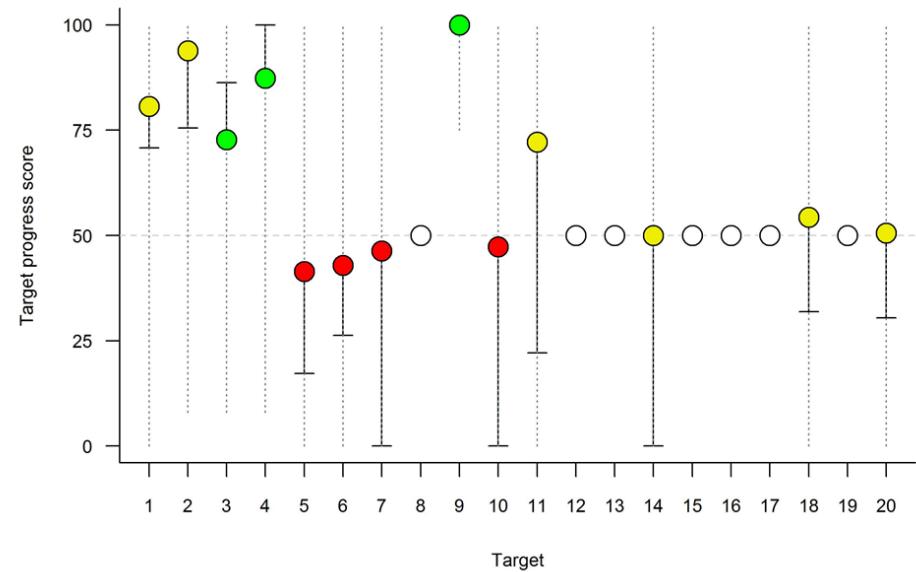

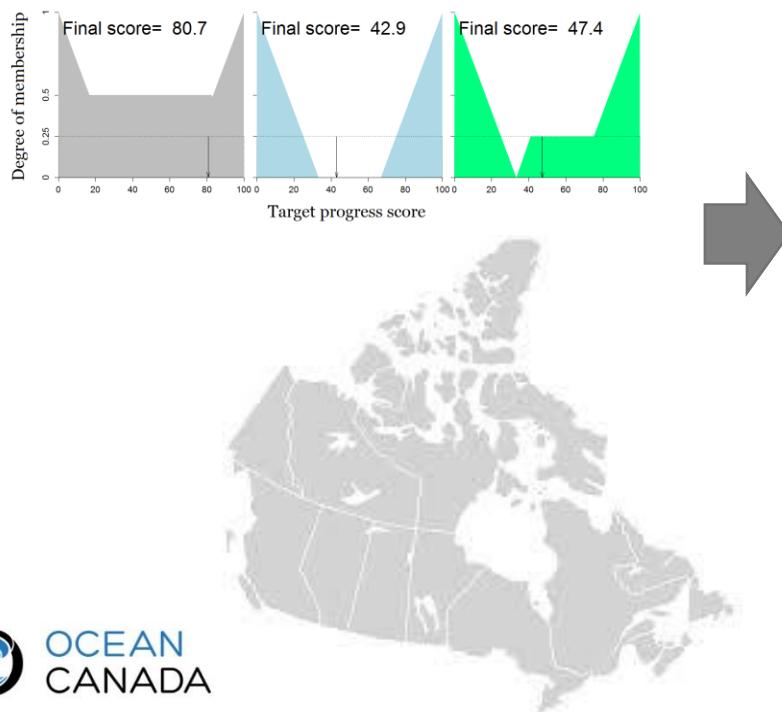

Evaluating biodiversity goals: fuzzy logic framework

Criteria	Set	Rules	Progress set
Recent state (ratio Δ since 1993)	Very good	$+0.4 \leq \Delta$	Very High
	Good	$0 \leq \Delta < +0.4$	High
	Medium	$-0.2 < \Delta < +0.2$	Medium
	Poor	$\Delta \leq 0$	Low
Absolute trend (ratio Δ since initial data)	Very good	$+0.2 \leq \Delta$	Very High
	Good	$0 \leq \Delta < +0.4$	High
	Medium	$-0.2 < \Delta < +0.2$	Medium
	Poor	$\Delta \leq 0$	Low
Time (years in time series)	Very long	$12 \leq \text{Years}$	Very High
	Long	$8 \leq \text{Years} < 16$	High
	Medium	$4 < \text{Years} < 12$	Medium
	Short	$\text{Years} \leq 8$	Low
Space (local to national scope)	Large	Ocean or Nation	Very High
	Medium	Region or Province	High
	Small	Point location or Statistical Area	Medium
Suitability (as indicator for target)	-	Rank from 1 (medium) to 10 (excellent)	-

Next steps

- The 2020 Aichi Biodiversity Targets (ABT) are great goals for sustainability, yet difficult to evaluate;
- Fuzzy logic can incorporate multi-disciplinary criteria to assess ABT progress;
- The method can be adapted to assess progress towards other goals, globally or regionally;
- Selecting indicators to include in the fuzzy logic method requires multi-disciplinary collaboration.

Thank you!

Metadata database

- Approx. 1,100 records referencing 16,500 individual time series;
- Government (702), NGO (314), academic (50);
- Coverage 1800s—, average 1979-2012.

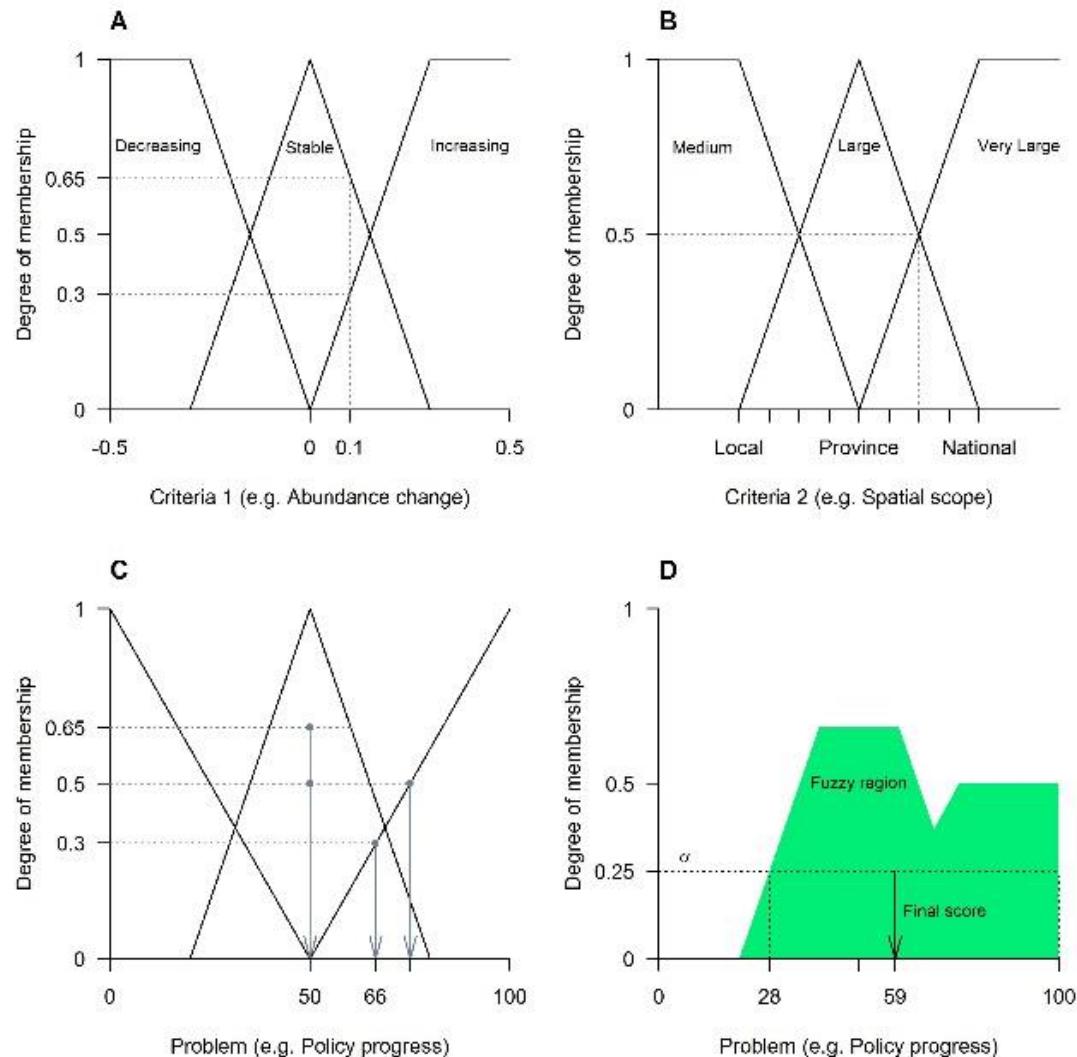

Current findings: Research themes

- Research directly related to resource use (72% fisheries) is most common;
- Single-species research is still a large component;
- The Pacific region has the highest proportion of non-fisheries records.

Evaluating biodiversity goals: fuzzy logic framework

- Heuristic categories evaluated for each indicator corresponding to a target;
- Resulting memberships combined into an overall score incorporating all indicators selected, regardless of their type.

Current findings: Key species

- Species with most metadata records in the Pacific are Pacific herring (11%), groundfish (10%) and bocaccio rockfish (likely due to overlap between fisheries and COSEWIC assessments; 7%);
- Overall, the top 1% of species with the most records account for 30% of all records.

Species	
1	Pacific herring
2	Groundfish
3	Bocaccio rockfish
4	Coho salmon
5	Waterbirds
6	Shrimps
7	Chinook salmon
8	Sockeye salmon
9	Skates
10	Pacific sardine

Species
1 Arctic char
2 Beluga
3 Narwahl

Species
1 Snow crab
2 Atlantic cod
3 Atlantic herring
